

Group II base oils Outperform Group I base oils

The purpose of this chart is to show the huge difference between Group I and Group II base oils, when measuring additive depletion ratios.

This Chart clearly indicates the beneficial difference between a Group I base oil and Group II base oil. As illustrated, Group II base oils outperform Group I hands down. The vertical line indicates working hours of a hydraulic fluid. The Measured hours are to indicate at what stage the additives starts to break down when reaching a TAN (Total acid number) of 2.
